The approach we have developed is based on NURBS (Non-Uniform Rational B-Splines), a standard technology employed in CAD systems. We propose to match the exact CAD geometry by NURBS surfaces, then construct a coarse mesh of "NURBS elements".

To add to what others have said, it's important to note that finite element displacements are most accurate at the nodes. However, derived values (i.e. stresses and strains) tend to be most accurate at the integration points (and sometimes least accurate at the nodes).

FEMs are widely used in education, research, and industries. What is the prospect of having a vibrant community to evolve an open-source finite element code?

In mathematics, a group is a set equipped with a binary operation which combines any two elements to form a third element in such a way that four conditions called group axioms are satisfied, namely closure, associativity, identity and invertibility.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
